

Block 2 Challenge Proposal

David Headrick

CIT 261

Purpose

I propose to create a web application that, based on user search criteria (i.e., artist, album, song) can connect to an external music lyrics API, parse the data, and display the data on a web page.

Audience

The audience for this web application is anyone who enjoys music, but don't know the lyrics to their favorite songs.

Data sources

I intend to use an external API from a free source. Some possible sources include: Deezer API, Mourits Lyrics API, Genius API.

Colors/Typography/specific Element styling

I will likely use a color scheme tool generator from colors.co, and fonts from Google fonts, and styling from Bootstrap.
